

What is a Carnot battery?

In 2018, the name “Carnot battery” was used at the Hannover Messe, one of the world's largest trade fairs, by DLR. A Carnot battery system can be divided into three parts: Power to Thermal (P2T), Thermal Energy Storage (TES), and Thermal to Power (T2P). Electricity can be converted into heat through the use of various technologies.

Can a Carnot battery store electricity at a low cost?

There is a need for large scale electrical energy storage. The Carnot battery allows to store electricity at low cost with no geographical constraints. Each configuration of Carnot battery is described. A comparison is proposed including a state of the art, potential on the energy market and existing prototypes.

How does a Carnot battery system work?

A Carnot battery system can be divided into three parts: Power to Thermal (P2T), Thermal Energy Storage (TES), and Thermal to Power (T2P). Electricity can be converted into heat through the use of various technologies. Heat pumps as the technology to pump heat from a lower temperature reservoir to a higher temperature.

How efficient are Carnot batteries?

Carnot batteries generally aim for a 40-70% efficiency range, significantly lower than pumped-storage hydroelectricity (65-85%). Carnot batteries can be used as grid energy storage to store excess power from variable renewable energy sources and to produce electricity when needed.

Are Carnot batteries a cost-effective energy storage solution?

In the increasing need of medium and long duration energy storage, Carnot batteries (CB) offer a potentially cost-effective solution with systems ranging from large grid scale applications down to even dozens of kW. Therefore, the concept has attracted not only academic, but already also considerable industrial, research and development.

Is a LAES Battery A Carnot battery?

As was discussed, LAES stores electrical energy as heat, and not as mechanical energy, hence it should be considered a proper Carnot battery. To store electrical energy, LAES exploits the liquefaction of air, which is a convenient way to store latent heat. Liquefied air is produced cryogenically, at -196°C , which is the boiling point of nitrogen.

The Carnot battery specifications regarding power and capacity differ substantially in the investigated three scenarios (see Section 2.3), their configuration is displayed in Fig. 6. The installed power of Carnot batteries are 3.7 GW in the Base scenario, 15.8 GW in the Low Flex scenario, and up to 35.8 GW in the No Grid scenario.
