

Battery bank in substation Philippines

How are substation battery banks purchased?

The substation battery banks are sized and purchased by the substation engineering activity. Battery banks are purchased direct from pre-approved battery bank manufacturers. Battery banks are purchased for individual substation projects and for replacement of deteriorated existing banks throughout the system as needed.

What are the different types of battery banks used for substation applications?

There are two major types of battery banks used for substation applications; lead acid and nickel cadmium. The nickel cadmium battery banks are about twice the cost of lead acid for the same size bank. The major advantage that nickel cadmium batteries have over lead acid is their performance in poor climatic conditions.

What voltage auxiliary supply system is used in power substation?

Today, normal DC auxiliary supply systems in power substation are operating on the 110 V or 220 V level. Battery, charger and distribution switchboard are

Where are battery banks purchased?

Battery banks are purchased direct from pre-approved battery bank manufacturers. Battery banks are purchased for individual substation projects and for replacement of deteriorated existing banks throughout the system as needed. Lead acid battery banks are purchased as close to their required need date as possible.

Why do substations need DC auxiliary power systems?

The higher (more important) role the substation plays from the complete distribution or transmission network point of view, the higher are the demands for the substation's DC auxiliary power systems. To meet the increased demands for reliability and availability, the DC system can be doubled (Figure 3).

What is an example of a low voltage substation?

Some systems at the substation may require lower voltages as their auxiliary supply source. A typical example of these systems would be the optical telecommunication devices or the power line carrier (PLC) equipment, which normally requires 48 V.

This is a good example of a typical rack-mounted, flooded-cell battery bank. Photo courtesy of C. In the U.S., these battery systems are subject to the provisions of National Electrical Code (NEC) [Art. 480]. There are no requirements to place the batteries within a separate enclosure, if the room is available only to qualified persons.

the Battery is floated across the Battery charger at 118-126V (2.16 V / 2.3 V per cell) and should be compatible for battery as per specification and also supplies the Battery current 50Amps. into batteries for higher voltage upto 130-152V (2.35 V / 2.75 V per cell). The charger shall provide extra voltage for Boost charging.

The battery bank provides the DC supply to load only in case the Battery charger breaks down or the AC supply to the battery charger breaks down. So in normal conditions, it is the charger that supplies DC power to protection, communication, control, and measurement devices running in the Electrical substation & not the battery bank.
