

How will Belgium's energy island contribute to the green energy transition?

The energy island will play an important role in the green energy transition for both Belgium and the broader European Union, which is why it receives substantial EU support. The project is backed by the REPowerEU initiative, which aims to reduce Europe's reliance on fossil fuel imports and accelerate the shift to sustainable energy.

Will Belgium's energy mix be reliant on imports in 2035-2050?

Belgium's existing generation facilities and already-approved investments can provide only half of what is needed in the long term. Therefore, new governments will soon have to consider the desired energy mix for the period 2035-2050 and how reliant the country is willing to be on imports.

How will energy consumption change in Belgium by 2050?

By 2050, energy consumption from buildings, transport, and industry will fall by around 40%. These efficiency gains will be mainly driven by increasing electrification. Although molecules will remain vital for some parts of industry, system operator Elia expects electricity consumption in Belgium to more than double by 2050.

Will Belgium's dependence on electricity increase in 10 years?

However, due to the rising demand for electricity, this will no longer be sufficient in 10 years' time. If policy remains unchanged, we will see Belgium's dependence on electricity imports steadily increase, from 50-60 TWh in 2036 to 70-90 TWh in 2050.

Will Belgium become more reliant on electricity imports?

If policy remains unchanged, we will see Belgium's dependence on electricity imports steadily increase, from 50-60 TWh in 2036 to 70-90 TWh in 2050. Without a long-term strategy on the future energy mix and new policy measures, Belgium will therefore become more reliant on electricity imports.

How will Belgium's energy landscape change over the next 25 years?

BRUSSELS | The Belgian energy landscape will undergo an immense transformation over the next 25 years, but the outlook is nevertheless positive. By 2050, energy consumption from buildings, transport, and industry will fall by around 40%. These efficiency gains will be mainly driven by increasing electrification.
