What are microgrids and virtual power plants?

Microgrids and virtual power plants (VPPs) are two remarkable solutions for reliable supply of electricity in a power system. Since these structures include distributed energy resources (DERs), scheduling of these resources is then very important .,

What are the most important components of a microgrid or VPP scheduling?

As it can be seen, the most important components of a microgrid or VPP scheduling that can be uncertain are wind power, solar power, load and market price.

Why are microgrids and VPPs important?

Since these structures include distributed energy resources (DERs), scheduling of these resources is then very important . Microgrids and VPPs share some important features like the ability to integrate demand response (DR); generation of distributed renewable energy; and storage at the distribution level.

What role do microgrids and VPPs play in decarbonization?

As the growth of DERs continues, microgrids and VPPs will play an increasingly important role in delivering essential energy services. These DER portfolios are vital to the world's decarbonization efforts, from energy access for emerging economies to balancing wholesale wind and solar resources in industrialized markets.

How to increase microgrid power?

increasing the microgrid power generated from renewable energy resources sale/purchase of electricity to national grid, sale of electricity to local market, sale of hydrogen, purchase of natural gas, purchase of biomass, penalty for demand that is not met and operational costs for the different facilities

Para ello, las virtual power plants recopilan datos en tiempo real de cada recurso conectado, como la demanda energética, la producción de energía, la capacidad de almacenamiento, etc., para prever patrones de demanda y cambios en los precios de la energía. Gracias a esto, permiten tomar decisiones informadas a la hora de gestionar la energía y asignar los recursos ...

To begin with, we review grid architectures, e.g., microgrids and virtual power plants, capable of accommodating BTM flexibility and desirable flexibility market designs, including peer-to-peer ...

Virtual power plant vs. virtual microgrid. When we talk about virtual options, we can't forget to mention the virtual microgrid. It is a separate category, supported also by FUERGY, which combines two concepts - physical microgrids and VPPs. Same as the physical one, a virtual microgrid allows users to share energy. ...

Generally, there are more than one scheme satisfying the above requirement. For example, P VPP could be equal if both the power output of the PVs and power consumption of the controllable loads are high or vice versa. However, to maximise the economic benefit (e.g. generating more ice cubes for sale), it is preferred that more flexible loads operate in slow or ...

Electric power systems have undergone several transformations, especially leveraged by the trends of digitalization, decarbonization and decentralization of the electric sector. Following the trends of decarbonization and decentralization, the increased penetration of distributed resources in the electricity grid brings new challenges and opportunities for system management. Virtual Power Plants vs Microgrids. Two similar concepts with critical differences, virtual power plants are fundamentally separate from microgrids. While microgrids are self-contained, VPPs are a bit more fluid and can constantly change in size, shape, and structure.

Some features of microgrids are investigated in [6], and a literature review on the stochastic modeling and optimization tools for a microgrid is provided.
