Do cracked solar panels work?

Cracked panels work if we define a working panel as one that produces a current. At least most of the time, cracks don't damage the solar cells themselves. These cells are among a solar panel array's most critical components. Even if a solar cell has been damaged, that doesn't compromise the entire panel.

If your solar panel is only cracked, you can try to repair it with silicone sealant or epoxy. These materials can be found at your local hardware store. Once you have repaired the crack, you should have the panel tested to see if it is still producing electricity. If your solar panel is shattered, it will need to be replaced.

Can a cracked solar panel cause a fire?

Indeed, a cracked solar panel can cause a fire, even though this is uncommon. Solar panels undergo rigorous testing to ensure they can handle different situations. Yet, harm to the panel can result in hidden cracks. These tiny cracks, called microcracks, might create hotspots within the cell, and these hotspots could potentially trigger fires.
