What is the future development direction of microgrids in China?

The future development direction of microgrids in China will therefore be towards an energy systemthat integrates electricity,gas,water,and heat resources,achieves mutual coupling,and solves the problems of efficient energy utilization and peak regulation .

What is a microgrid in China?

In 2004, China began to carry out research on the concept of microgrids as proposed by the United States. This research has been based on the connection of distributed generation to large electrical grids via AC (alternating current) microgrids and the impacts of microgrids on large grids.

Do microgrid technologies face new challenges in China?

After years of development in China,microgrid technologies have achieved remarkable results,but there are still a lot of smart device issues that need to be addressed throughout the entire microgrid system. At the same time,microgrid technologies faces new challengesunder the background of the new era of electricity sector development.

What are the advantages and disadvantages of micro-grid development in China?

Development of micro-grid in China also has many advantages. On one hand, renewable resources in China are very abundant. With the progress of technology, the cost of the development and utilization of renewable resources is declining.

Are there bottlenecks in the development of Microgrid technology in China?

Although the development of microgrid technology in China has achieved some remarkable results, there are many bottlenecks in the comprehensive application and operation and control mode of microgrids involving advanced power electronics, computer control, communications and other technologies.
