

Common mode voltage of photovoltaic inverter

What is a transformerless PV inverter?

In a transformerless PV inverter, the common mode voltage will be produced while the inverter is being worked and results in the high-leakage current on the capacitor CPV [71, 72]. In order to suppress the leakage current, the common mode voltage should be reduced or kept constant.

Are transformerless PV inverters suitable for a three-phase two-level inverter?

Furthermore, to introduce the development of transformerless PV inverters, especially in three-phase two-level inverter systems, this paper provides a comprehensive review of various common-mode voltage reduction three-phase two-level inverters. 1. Introduction

Are impedance-source inverters suitable for PV applications?

Nevertheless, if compared with the traditional inverter, the impedance-source inverters can give a higher voltage gain and provide the shoot-through immunity. These inverters can be considered with competitive solutions in PV applications. Figure 10. The components for topologies enlisted in Table 3 .

Can a transformerless inverter cause common-mode voltage and leakage current?

However, the problem is that common-mode voltage and leakage current can occur via the stray capacitors between the PV array and the ground of the inverter. Various transformerless inverters have been introduced with different techniques, such as reducing the common-mode voltage or eliminating the leakage current.

What are the disadvantages of grid-tied transformerless PV inverters?

Still, some drawbacks exist in the grid-tied transformerless PV inverters produced by the non-usage of the line transformer. Common mode voltage arises in the grid and PV array due to galvanic connection which creates common mode currents, electromagnetic interferences, grid current distortion and additional losses in the system .

Is there leakage current in PV inverter system?

As a result, there is no leakage current in the inverter system. To provide the boosting voltage and achieve the common-ground between PV panel and the grid, the common-ground quasi-Z-source inverter is reported in [83], as shown in Figure 9 d. Figure 9. Active impedance-source topologies for CMV reduction.
