

Can PV power generation and EV charging units be used in a microgrid?

The power of the PV power generation and EV charging units in the integrated standalone DC microgrid is uncertain. If no reasonable countermeasures are taken, the power variation will lead to a significant deviation in bus voltage and reduce the stability of the microgrid system.

Can photovoltaic and electric vehicles charge in integrated DC microgrids?

The power of photovoltaic (PV) and electric vehicles (EV) charging in integrated standalone DC microgrids is uncertain. If no suitable control strategy is adopted, the power variation will significantly fluctuate in DC bus voltage and reduce the system's stability.

What is the energy coordination control strategy for the integrated dc microgrid?

For the integrated DC microgrid, the designed energy coordination control strategy should meet the following conditions: Ensure the power supply of the EV charging unit. Ensure the charging and discharging power of the energy storage device is below the limit. Maximize the use of PV energy as much as possible.

How energy storage unit regulates power balance in integrated dc microgrid?

The energy storage unit regulates the system power balance in the integrated DC microgrid. When the output power of the PV generation unit is larger than the absorbed power of the load, the energy storage unit absorbs the energy in the system by charging; conversely, the energy storage unit provides energy to the system by discharging.

What is integrated standalone dc microgrid?

The integrated standalone DC microgrid is modeled, which contains PV, hybrid energy storage system EV charging. For the PV power generation unit, an MPPT control based on a variable step perturbation observation method is proposed to increase the tracking speed at the maximum power point and reduce the power oscillation during the tracking process.

What is the energy management strategy for a dc microgrid?

However, efficient management of these microgrids and their seamless integration within smart and energy efficient buildings are required. This paper introduces an energy management strategy for a DC microgrid, which is composed of a photovoltaic module as the main source, an energy storage system (battery) and a critical DC load.
