Fault location in microgrid

How to detect faults in a microgrid?

The proposed method is applied to detect, classify, and locate faults in a microgrid by using the one-terminal voltage and current data, measured at each distribution line of the microgrid. The measured currents and voltages are first filtered by a low-pass Butterworth filter to remove higher order harmonics.

How to detect fault in a microgrid using mathematical morphology and recursive least-square?

This paper proposes fault detection and location in a microgrid using mathematical morphology (MM) and recursive least-square (RLS) methods. MM is used to detect and classify the fault in a microgrid. The features of the fault current waveform captured by using MM operator and compare it with the threshold for fault detection and classification.

How is fault location determined in microgrids using mm and RLS methods?

This paper proposes fault detection and location in microgrids using MM and RLS methods. An MM operator has been used to detect and classify the fault. The fault location estimation is obtained through the RLS method, which works directly on voltage and current samples acquired at one-terminal of the MV line segment.

What is the fault current of An islanded microgrid?

The fault current of an islanded microgrid is of 5 times of the load current.Here,the OC protection scheme is set to get activated at 2-10 times of the full load current. This can be reduced to 2-3 times of the full load current for converter based DERs in microgrid.

How does a microgrid affect a power distribution network?

However,microgrid causes a significant operational changes in power distribution networks, such as bidirectional power flow, reduced fault current level during islanded mode, and looped feeder, which has a direct impact on fault detection and location in microgrids ,...

Does MATLAB/Simulink improve shunt fault detection and location process in microgrids?

Several simulations have been performed in MATLAB/SIMULINK for different types of shunt faults in radial and looped topologies of microgrids for both grid-connected and islanded modes. These simulation results show that the proposed method improves the fault detection and location process in a microgrid.

based on dq0 system is derived for fault location, nature and fault identification in microgrid system. Since Id and Iq components are independent of each other, any variation of either of ...

DC microgrids are gaining more importance in maritime, aerospace, telecom, and isolated power plants for heightened reliability, efficiency, and control. Yet, designing a ...

A non-iterative fault-location technique using a probe power is also presented in this paper. This probe power can also be used for a pilot test before main CB reclosing to avoid system issues ...

Abstract: This paper proposes a novel method to locate faults in an AC-meshed microgrid. To this end, a set of features is first extracted and selected from the measured signals and fed to a ...

The focus of both [33], [34] is on fault detection and classification rather than finding the location of the fault along DC microgrid cables. On the other hand, more recently, ...

The detection accuracy of the proposed algorithm on various scenarios of internal fault location within the DC microgrid is presented in Table 3. For example, in a fault ...

This article presents a technique that employs measurements of three-phase voltage, current, and angle during a fault as input data for a module that classifies and locates faults. This module, ...

To address the aforementioned issues, this article proposes a novel local fault location scheme for meshed dc microgrids. Low- and high-impedance faults are located by measuring the current ...

However, as fast location and isolation of fault is desirable in DC microgrid, less time period/data is available for estimation of the fault distance. Techniques for online estimation of fault ...

As indicated by fault location 2 in Fig. 1, the measurement point for the voltage controller is the same as bus voltage, hence V b u s = V d c even after the arc fault starts. ...
