

How do you install a vacuum generator tube?

To install a vacuum generator tube, insert it into the Push-In Fitting of the vacuum generator up to the tube end. The Lock-claws bite the tube to fix it and the elastic sleeve seals around the tube. For instructions, refer to '2. Instructions for Tube Insertion' under 'Common Safety Instructions for Fittings'. The tube is disconnected by pushing the release-ring to release the Lock-claws.

What is the wiring circuit of cvxcek units?

Wiring circuit of the CVXCEK units is PNP, Sourcing. Each vacuum generator sensor has 2 outputs. Output 1 and Output 2 are independent of each other and have different factory set conditions. These settings can be changed with the touch pad programming. Minimizes air consumption by utilizing the built in check valve.

Can a vacuum generator be panel mounted?

vacuum applications that due to system porosity issues have a low application degree of vacuum. These units are ideal for porous applications. 4 bolt mounting pattern with gauge opposite of vacuum and pressure inlet ports enables this generator to be panel mounted.

Can a cvxcek Venturi generator be mounted in a manifold?

Inline versions can be mounted in manifolds up to 5 stations. CVXCEK Venturi Generator is a basic 2 station CEK Generator Manifold with the addition of Emergency Stop Functions that maintains the last state of air during an emergency stop or power loss. This unit can be used for high-speed pick and place and material handling systems.

Can a vacuum generator drop a work-piece during vacuum suction?

If a work-piece may fall during vacuum suction, take a safety measure against it. Do not supply more than 0.1MPa pressure constantly in a vacuum circuit. Vacuum generators are not explosive-proof, so there is a risk of damaging the products.
