Can vertical axis wind turbine airfoils increase wind power efficiency?

The current H-type vertical axis wind turbine (VAWT) airfoils are from horizontal axis wind turbine airfoils or symmetry airfoils that are designed at one angle of attack (such as  $\alpha = 6^\circ$ ) rather than different angles of attack. As a consequence, it cannot, to a certain extent, increase wind power efficiency.

How to design a vertical-axis wind turbine with straight blades?

Designing a vertical-axis wind turbine with straight blades requires plotting power coefficient  $c_p$  against tip speed ratio  $\lambda$ , as a function of rotor solidity  $s$  (Fig. 1). Power coefficient for a VAWT, straight blades and symmetric airfoil

How is a vertical axis wind turbine (VAWT) H-Darrieus designed?

Numerical simulation is used to predict the performance of a Vertical Axis Wind Turbine (VAWT) H-Darrieus. The rotor consists of three straight blades with shape of aerofoil of the NACA family attached to a rotating vertical shaft. The influence of the solidity is tested to get design tendencies.

What is H-type vertical axis wind turbine (VAWT)?

H-type vertical axis wind turbine (VAWT), as a kind of wind turbine, will be widely used in the world because of high adaptability for working condition, simple structure, simple blade manufacturing, without yaw device and easy installation.

How can helical blade vertical axis wind turbines be optimized?

Furthermore, static structural and modal analyses were also performed which are indispensable tools in the development and optimization of helical blade vertical axis wind turbines.

Can H-type VAWT blade airfoils increase wind power efficiency?

As a consequence, it cannot, to a certain extent, increase wind power efficiency. Therefore, an optimal method of H-type VAWT blade airfoils in different ranges of angles of attack is presented.
