How do solar photovoltaic panels work?

Solar photovoltaic (PV) panels are based on a high-tech but remarkably simple technology that converts sunlight directly to electricity. It's an idea that has been around for well over a century. In 1839, French scientist Edmond Becquerel discovered that certain materials would give off sparks of electricity when struck with sunlight.

How do solar panels convert sunlight into electricity?

At the heart of every solar panel lies the photovoltaic (PV) cell, the unsung hero responsible for transforming sunlight into electricity. These cells, typically made from silicon, a semiconductor material, are the workhorses that drive the entire process. But how does this conversion happen? Imagine a silicon atom like a miniature solar system.

How does a solar panel produce electricity?

The current generated by a single PV cell is miniscule. To produce usable electricity, multiple cells are interconnected and encased within a protective glass and frame, forming a solar panel. However, the electricity generated by these panels is direct current (DC), which most appliances cannot directly use.

What makes a solar panel a powerhouse?

**The Powerhouse: The Photovoltaic Cell** At the heart of every solar panel lies the photovoltaic (PV) cell, the unsung hero responsible for transforming sunlight into electricity. These cells, typically made from silicon, a semiconductor material, are the workhorses that drive the entire process.

Are solar panels a viable option for domestic electricity production?

Solar panels are appearing on more and more rooftops around our suburbs as solar photovoltaics (PV) become an increasingly viable option for domestic electricity production. Photovoltaic solar cells, such as those in these rooftop panels, convert light directly to electricity. Image source: Marufish / Flickr. But how exactly does it work?

How are solar panels made?

Solar panels are usually made from silicon, or another semiconductor material, installed in a metal panel frame with a glass casing, all of which can be extracted, separated and recycled or reused. The remaining one percent is an encapsulant material that bonds the layers of a panel together.

The electrons flow through the semiconductor as electrical current, because other layers of the PV cell are designed to extract the current from the semiconductor. Then the current flows through metal contacts--the ...
