Solar panel fault-finding guide including examples and how to inspect and troubleshoot poorly performing solar systems. Common issues include solar cells shaded by dirt, leaves or mould. Check all isolators are all on, and the circuit breakers have not tripped off. Check the grid voltage on the inverter display or app for over-voltage issues.

What is solar panel testing?

Testing solar panels refers to evaluating the performance, efficiency, and overall condition of solar photovoltaic (PV) panels to ensure they generate electricity as intended. This testing can involve various methods and assessments to verify that the solar panels are working effectively and producing the expected electricity.

How do I know if my solar panels are good?

Start by visually inspecting the solar panels. Check for any physical damage, such as cracks or scratches on the glass surface. Ensure that the panels are clean and free from dirt, leaves, and bird droppings, as these can reduce efficiency. 2. Shade Analysis Observe the area around your solar panels and identify any potential sources of shading.

How do I know if my solar system is working?

Check the solar system performance data on the app and website, if available. Check the solar panels for dirt, leaves, mould, or shade issues. Check the solar inverter for any warnings or faults. Check that the isolators are all on and that the circuit breakers have not tripped off.

How do I know how much energy my solar panels are producing?

If you want to keep track of how much energy your solar panels are producing, you can use a solar monitoring app. This app will show you how much power your solar panels are generating on a daily, weekly, or monthly basis.

How to test a solar panel?
