

How to divide the photovoltaic panels into strings

How to design a solar PV system?

When designing a solar PV system it's critical to know the minimum and maximum number of PV modules that can be connected in series, referred to as a string. PV modules produce more voltage in low temperatures and less voltage in high temperatures.

What is a solar panel & a string?

A solar panel, or we can say a PV module, is made up of several cells, where multiple solar panels are wired in a series or parallel. The design is known as a solar array. A string consists of solar panels that are wired in a series set to one input on a solar string inverter.

How many solar panels can be connected in a string?

1. Calculating maximum string size The maximum number of solar panels you can connect in a string is determined by the maximum input voltage of your inverter or charge controller. You can find this value on the inverter datasheet. If the maximum input voltage of your inverter is exceeded on a cold day, the inverter can be damaged.

How do I calculate the minimum solar panels per string?

According to the Solar Design Guide, to calculate the minimum panels per string: Determine the startup voltage of your inverter. 2. Divide the startup voltage by the panel voltage. 3. Round up to ensure you have enough voltage to meet the inverter's requirements.

What is the minimum solar PV string size?

Rounding up, the minimum string size is 7 panels. Understanding the intricacies of solar PV strings, including how to calculate the number of panels per string and the importance of startup and maximum DC voltage range, is essential for optimising your solar power system.

What is a solar PV string?

A solar PV string is a series of solar panels connected in a sequence to form a circuit. The panels in a string are connected by their positive and negative terminals, creating a single path for the electric current. The number of panels you can have on a string depends on several factors, including:
