

Installation of solar power in mountainous areas

Should solar panels be installed on snow-covered mountains?

The placement of solar panels on snow-covered mountains can boost the production of electricity when it is most needed -- in the cold, dark winter. Solar-power systems have long been hampered by a seasonal problem: the panels produce more energy in summer than in winter, at least in the mid-latitudes, where much of the planet's population lives.

Can solar power be installed in a snowbound area?

The state plans to set up a one-gigawatt solar power plant in the Spiti Valley, an area that typically sees more than 300 clear and sunny days in a year but remains snowbound for up to a third of the year. Installing solar power plants in snowbound areas offers an important avenue for reducing pollution and mitigating climate change.

Can solar power be installed in high-altitude countries?

There are many high-altitude developing countries across the world with solar potential, Armenia and Serbia to name a couple. Yet, despite the clear skies and low temperatures in snowbound, hilly regions that may be conducive to solar photovoltaics, installation in these areas is no easy task.

Should solar panels be installed vertically?

Installing the panels vertically -- which allows snow to slide off -- enhanced their output even more. In the depths of winter, panels placed at an optimal orientation on snow-covered mountains produced up to 150% more power than panels in urban locations, the authors found.

Could a solar power plant be set up in Himachal Pradesh?

But Himachal Pradesh, a hilly state in northern India where snow and sun abound, is about to break new ground. The state plans to set up a one-gigawatt solar power plant in the Spiti Valley, an area that typically sees more than 300 clear and sunny days in a year but remains snowbound for up to a third of the year.

Can solar panels be installed in snow?

The thought of installing solar panels in isolated, snow-bound regions with harsh weather conditions may seem far-fetched. But Himachal Pradesh, a hilly state in northern India where snow and sun abound, is about to break new ground.

In alpine areas, the temperature is negatively correlated with altitude. Although temperature inversion effects are possible in such regions as well, they still have a lesser effect on solar power, since they typically occur ...
