What is wind power?

Wind power is a form of energy conversion in which turbines convert the kinetic energy of wind into mechanical or electrical energy that can be used for power. Wind power is considered a form of renewable energy. Modern commercial wind turbines produce electricity by using rotational energy to drive a generator.

How does a wind turbine generate energy?

Generating wind energy is all about kinetic energy, aka the energy of motion. Anything that moves--a person walking, a dog running, a book falling--has kinetic energy. A wind turbine takes the kinetic energy of wind and turns it into electrical energy.

How much electricity does a commercial wind turbine produce?

According to the U.S. Energy Information Administration, the average output of a new commercial wind turbine is 843,000 kilowatt-hours of electricity per month. The average U.S. home uses about 893 kilowatt-hours of electricity a month, so a single commercial wind turbine could power nearly 1,000 homes.

What are the different types of wind turbines?

The most common type of turbine used in the United States today are horizontal-axis wind turbines, which have two to three long, flat propeller blades that face the direction of the wind. Less common are vertical-axis wind turbines, which have blades that look like the beaters in a mixer and don't have to face the wind to capture energy.

What are the advantages of wind as a power source?

Wind as a power source offers several advantages. The associated infrastructure, including wind turbines and power stations, is quick to install. It is also scalable, as a wind farm can consist of just a few turbines or hundreds, based on the energy needs it covers. Additionally, wind power has a low-carbon footprint throughout the life cycle of the project.

Is the wind energy industry booming?

Nevertheless, the wind energy industry is booming. Thanks to global efforts to combat climate change, such as the Paris Agreement, renewable energy is seeing a boom in growth, with wind energy leading the way. From 2000 to 2015, cumulative wind capacity around the world increased from 17,000 megawatts to more than 430,000 megawatts.
