### Islanding in smart grid Montenegro

#### What is islanding in a microgrid?

Islanding can be described as an instance, where the grid-connected microgrid gets isolated from its points of common coupling (PCC) with the utility. According to the IEEE 1547 standards, the unintentional islanding instances must be detected within 2 s of their occurrence.

How can a distributed generation system detect islanding?

The self-sufficiency of islanding phenomenon can make severe effects to repair personnel and electrical apparatus even the power grid. So the distributed generation system needs to be able to suitably detect the occurrence of islanding [7,26]. At present, the islanding detection methods include local detection and remote detection technology.

How to determine Islands boundary based on time varying graph structure?

The determination of islands boundary is addressed by considering a time varying graph structure. The designed method has been applied to IEEE 39-bus and Iran power networks. There are lots of other reported ICI strategies implemented on real-life practical networks.

Unintentional islanding, defined as the inadvertent separation of distributed generators from the main grid, is a significant issue for wind power and synchronous-based microgrid. Islanding events must be detected to ensure safety and protect utility workers and equipment. The improper detection islanding may lead to power quality degradation, grid ...
