Are fuel cells suitable for ship power systems?

Fuel cells have formed various fuel cell power systems with different power levels to be used in ships. Therefore, selecting an appropriate fuel cell power system and fuels would have significant effects on the suitability for ship power systems.

What is the future of alternative fuel ship propulsion?

Of all alternative fuel ships on order, 40% are vessels with hybrid/battery propulsion systems, and their proportion is growing. Electrification of ship propulsion is increasingly recognised as a core part of the maritime industry's future, especially with the ongoing developments taking place in battery energy storage systems.

Can a cold thermal energy storage system be integrated in an all-electric ship?

A 1D numerical model to evaluate the integration of a cold thermal energy storage (CTES) system in an all-electric ship is presented by Yang et al. . The mathematical model considers a PCM as storage media but taking into account a limited number of parameters in its equations.

Can new energy sources be integrated into traditional ship power systems?

The integration of new energy sources into traditional ship power systems has enormous potential to bring the shipping industry in line with international regulatory requirements and is set to become a key focus of ship-related researches in the immediate future.

Is hybrid power a viable option for deep-sea shipping?

However, hybrid power generation and propulsion are feasible for certain operational modes . Fuel cells and renewable energy sources are applicable for deep-sea shipping. The capability to use alternative fuels in ICEs and fuel cells or renewable energy are the major drivers for emission reduction.

How is the capacity of the storage tank optimized?

The capacity of the storage tank was optimized based on the distribution of the energy demand of the auxiliary systems during the port stays of the ship, evaluated during the 31 months of measurements (Fig. 5.12). From this data, the estimated amount of thermal energy required in port between 200 and 300 GJ.

SeaLand's polyethylene tanks are 3/8" thick, more than any of its competitors. Tanks come with brass mounting spindles that are screwed to the floor and then fit into molded slots in the tank's four sides. The number of ...
