

Why is New Zealand transitioning to a highly renewable electricity system?

New Zealand is transitioning to a highly renewable electricity system. This change will require increased and accelerated investment in new electricity generation to match demand growth and the retirement of thermal power plants.

Why should New Zealand increase electricity production?

Increasing electricity production will also enable the decarbonisation of the economy- which is needed to meet New Zealand's climate goals. Despite the building of more renewable generation plants, future prices 1 for winter 2024, 2025 and 2026 remain high (see figure 1).

Does New Zealand rely on fossil fuels?

Please try again later. Most of New Zealand's energy is supplied by fossil fuels, including 99% of transport energy, and around 60% of industrial energy. Much of our electricity is generated from renewable energy sources (80-85%), which is promising for reducing our reliance on fossil fuels in the future.

How does New Zealand meet its energy needs?

New Zealand relies on a combination of domestically produced and imported fuel to meet its energy needs. A common metric used internationally to measure this is a self-sufficiency indicator, which shows how well we can meet our own energy supply needs through domestic production.

How does electricity supply work in New Zealand?

Supplying electricity to homes and businesses across New Zealand involves three key elements: generating electricity, transporting electricity to distribution companies, and then selling it to customers.

How much electricity does New Zealand use?

National electricity consumption was also relatively unchanged, up 0.2 per cent (69 GWh) to 39,130 GWh in 2023. For the first time, residential consumption surpassed industrial consumption to become the largest sector of electricity consumption in New Zealand.
