

Off-grid energy storage system costs

What is off-grid energy storage?

While mentions of large tied-grid energy storage technologies will be made, this chapter focuses on off-grid storage systems in the perspective of rural and island electrification, which means in the context of providing energy services in remote areas. The electrical load of power systems varies significantly with both location and time.

Are off-grid systems cheaper than grid-extension?

For the most part, grid-extension is the least-cost option, but given that its cost range can vary widely, off-grid systems are the preferred option in some cases. Out of these 16 publications, only 7 of them provide evidence of costs explicitly comparing these options, either using generation costs, levelised costs or LCC metrics.

How much does gravity based energy storage cost?

Looking at 100 MW systems, at a 2-hour duration, gravity-based energy storage is estimated to be over \$1,100/kWh but drops to approximately \$200/kWh at 100 hours. Li-ion LFP offers the lowest installed cost (\$/kWh) for battery systems across many of the power capacity and energy duration combinations.

How much does off-grid electricity cost?

Nevertheless, the studies reviewed show a range of around \$0.2-1.4/kWh for off-grid electricity access, compared to a range of below \$0.1/kWh to more than \$8/kWh for grid access, pointing to a number of cases in which off-grid access may already be the more cost-effective option.

Which energy storage technologies are best for off-grid installations?

Electrochemical storage technologies are the most common solutions for off-grid installations. If nonelectrical energy storage systems, such as water tanks for a pumping system or flywheels or hydrogen storage in specific locations and contexts, are sometimes a relevant solution, they are not as common as electrochemical storage technologies.

What are the barriers to off-grid energy storage?

The chapter discusses the barriers to off-grid energy storage, providing international examples. For rural communities where residents have small incomes, it is not realistic to recover the costs directly from them. Therefore, there is a need for government support for such locations and communities.

This differs from traditional solar power systems, which are still tied to the grid and may occasionally pull energy from a utility. Off-grid systems cost an average of \$45,000-\$65,000--almost double the cost of a typical grid ...
