Are domestic battery energy storage systems safe?

Despite a limited number of known incidents with domestic battery energy storage systems (BESSs) in the public domain, questions have been raised regarding their safety due to the large energy content within these systems.

Are solar batteries safe?

In general, solar batteries are very safe. Lithium-ion, salt water, and lead acid batteries are the main types of solar battery systems available and are all safe to pair with a home solar system. These three battery categories have their own advantages and disadvantages, but all share the distinction of being a safe home storage option.

Are large battery energy storage systems a safety hazard?

The use of large battery energy storage systems (BESSs) in the domestic environment represents a safety hazard, even though few incidents are known in the public domain.

Are grid-scale battery energy storage systems safe?

Despite widely known hazards and safety design of grid-scale battery energy storage systems, there is a lack of established risk management schemes and models as compared to the chemical, aviation, nuclear and the petroleum industry.

Are lithium-ion batteries safe for electric energy storage systems?

IEC has recently published IEC 63056 (see Table A 13) to cover specific lithium-ion battery risks for electric energy storage systems. It includes safety requirements for lithium-ion batteries used in these systems under the assumption that the battery has been tested according to BS EN 62619.

What are the risks associated with battery storage?

The risks associated with storing batteries for energy include: Thermal runaway: Often caused by Li-ion battery defects or damage, which results in excess heat, leading to fires or explosions. Failure of control systems: Failure in the systems can result in overheating, which can cause fires.
