What are the different types of solar inverters?

When it comes to home solar installation, homeowners have three types of solar inverters to consider: string inverters, string inverters with DC power optimizers and microinverters. Each inverter setup comes with upsides and downsides. Here's what you should know.

What is a solar inverter?

The solar inverter is one of the most important parts of a solar systemand is often overlooked by those looking to buy solar energy. This review highlights the best inverters from the world's leading manufacturers to ensure your solar system operates trouble-free for many years.

How do I choose the best solar inverter?

However, string inverters are often a great choice for simpler, unshaded roofs. Choosing the best solar inverter involves considering performance, warranties, cost, and your personal preferences. Let's explore the different types of inverters, how to compare your options, and our top picks for 2024.

Should I get a solar inverter with a bigger wattage?

Getting a solar inverter with a much larger wattage than your solar array can cause efficiency and performance issues. An installer will properly size your inverter with your solar panel system based on the size of your solar array and the amount of sunlight your home receives throughout the day.

How much power should a solar inverter produce?

For microinverters: The maximum output power should be about the size of your solar panels (typically 300-400+Watts). For string and optimized string inverters: The maximum output should be close to the size of your solar panel system (typically about 5-10 kilowatts(kW)).

What are the different types of PV inverters?

There are three primary tiers of PV inverters: microinverters, string inverters, and central inverters. Since microinverters are not rated for utility-scale voltages, we will largely ignore them in this article. String inverters convert DC power from "strings" of PV modules to AC and are designed to be modular and scalable.
