

Photovoltaic panel I-V characteristic curve analysis

What is a PV characteristic curve?

Figure 1. Classification of photovoltaic technologies [18, 19, 20, 21]. The PV characteristic curve, which is widely known as the I-V curve, is the representation of the electrical behavior describing a solar cell, PV module, PV panel, or an array under different ambient conditions, which are usually provided in a typical manufacturer's datasheet.

How is electrical characterization of a PV panel achieved?

Electrical characterization of a PV panel is attained by measuring the I-V characteristics of field-aged modules and comparing them to the module's initial measured I-V characteristics before deployment in the field. Thus, any electrical properties variations are recorded to study PV panel performance.

Are PV models accurate in reconstructing characteristic curves for different PV panels?

Therefore, this review paper conducts an in-depth analysis of the accuracy of PV models in reconstructing characteristic curves for different PV panels. The limitations of existing PV models were identified based on simulation results obtained using MATLAB and performance indices.

How to characterize PV panel degradation?

Electrical analysis, such as monitoring the illuminated/dark curve, is one technique for characterizing PV Panel degradation. Electrical characterization of a PV panel is attained by measuring the I-V characteristics of field-aged modules and comparing them to the module's initial measured I-V characteristics before deployment in the field.

Can the I-V curve be used as a diagnostic tool for PV system faults?

The advantages and limitations of using the I-V curve as a diagnostic tool for PV system faults are discussed. In addition, the impact of series and shunt resistances on solar cell performance is highlighted and linked to related defects and degradation.

What are the I-V curves of PV modules under STC?

The product datasheet commonly sets out the I-V curves of PV modules under STC. In relation to a new PV module, the I-V curve should be within 5% of the rated I-V curve under stable irradiance conditions. Based on the PV mathematical model, I-V curves can be simulated under different conditions.
