How to predict power production of photovoltaic module using ambient weather conditions?

Prediction of power production of photovoltaic module considering ambient weather conditions. Predictive models have been developed using both artificial neural network and regression analysis. Solar irradiation, ambient and module temperature are key factors and important variables to estimate PV power generation.

Can ANN and regression analysis predict the power output of a PV panel?

Conclusion In this study, ANN and regression analysis have been employed to predict the power output of a 160 W PV panel located in El-Oued region, Algeria. For that purpose, six days of data were collected. In addition to power generated by the PV panel, several climatic variables were recorded.

Can Data Analytics predict deterministic and probabilistic solar power generation?

This study seeks to leverage the use of data analytics to produce deterministic and probabilistic solar power generation predictions on a short-term basis and analyse factors that affect the performance of solar PV generation at Bui Generating Station using historical data from the grid-connected solar PV plant.

How are predictive models used to estimate solar power generation?

Predictive models have been developed using both artificial neural network and regression analysis. Solar irradiation, ambient and module temperature are key factors and important variables to estimate PV power generation. Performance of developed models was evaluated and compared to other models in the literature.

How can solar PV output prediction help Bui Power Authority?

The models developed for solar PV output prediction could assist Bui Power Authority (BPA) and other utility companies to be more confident in their decision making with regards to planning and managing variable solar generation, scheduling, and operating other generating capacity efficiently and reducing the number of curtailments.

Why is modeling a solar photovoltaic generator important?

Modeling, simulation and analysis of solar photovoltaic (PV) generator is a vital phase prior to mount PV system at any location, which helps to understand the behavior and characteristics in real climatic conditions of that location.

The solar generation is used locally in the prior way, and if the solar generation produces more electricity than the consumption, the surplus will be exported to the power grid. The load curve ...
