

Can solar PV be used in Libya?

Future prospective of exploiting solar PV has been drawn in Libya. The solar photovoltaic (PV) is one way of utilising incident solar radiation to produce electricity without carbon dioxide (CO₂) emission. It's important here to give a general overview of the present situation of Libyan energy generation.

When was solar photovoltaics used in Libya?

The solar photovoltaics (PV) was used in Libya back in the 1970s; the application areas power loads of small remote systems such as rural electrification systems, communication repeaters, cathodic protection for oil pipelines and water pumping (Asheibi et al., 2016).

How much solar power does Libya have?

In-depth south regions of Libya, the daily average solar PV power protentional is greater than 6.5 kWh/kWp, although the annual average is greater than "2045 kWh/kWp". Fig. 5. Solar photovoltaic power potential in Libya (GSA, 2020).

Can a photovoltaic power plant be built in Libya?

(Aldali et al., 2011) presented a proposed design of a photovoltaic power plant based on Al-Kufra conditions. For the sake of friendly environmental effects and variation of the electricity generating mixture, it's also proposed that very large-scale photovoltaic plants of this kind be constructed in Libya.

Are grid-connected photovoltaics a good investment in the Libyan power system?

For those interested in the large dynamic of photovoltaics economics, a thorough analysis of grid-connected photovoltaics in the Libyan power system would be very beneficial as most firms will raise their profits and lower their costs (Almaktar et al., 2020), and described by (Almaktar and Shaaban, 2021).

How much does a PV system cost in Libya?

Opening the door through encouraging for vendors to imports such equipment or for developing industrial sectors locally. The PV system for electricity in the Libyan market is estimated to cost about "5-13,000" Libyan/denars (this price from private business companies); depending on the size/capacity that invested by the private sector.

This study addresses the current situation of solar photovoltaic power in Libya, the use of solar energy, and proposes strategies adopted by Libya to encourage future applications of solar photovoltaic energy and electricity generation.

The present work aims to determine the types of solar PV module technologies that are suitable for the climatic conditions of each region of Libya identified on the map. Due to the lack of weather data, the research utilized the data provided by Solargis Database Company in analyzing the performance of PV solar fields.

The image above represents a cross section of a solar cell. You can see the aluminum at the bottom of the panel that allows "used" electrons to flow back into the panel (thus completing the circuit) as well as the anti-reflective coating on top to allow the solar panel to absorb as much sunlight as possible.

In terms of our understanding of how different energy sources work, perhaps the photovoltaic effect is one of the least intuitive processes for the average person to comprehend. After all, something like capturing wind energy is much more straightforward. The wind spins a turbine, and that turbine generates electricity.
