Does a shared storage system have a complementarity of power generation and consumption?

In this context, considering the complementarity of power generation and consumption behavior among different prosumers, this paper proposes an energy storage sharing framework towards a community, to analyze the investment behavior for shared storage system at the design phase and energy interaction among participants at the operation phase.

Why is shared energy storage system important?

Shared energy storage system ensures the economic feasibility of all participants. With the rapid development of distributed renewable energy, energy storage system plays an increasingly prominent role in ensuring efficient operation of power system in local communities.

Is storage ESS economically viable?

Economics of storage ESS are gaining significance within the contemporary energy domain, encompassing various utilities such as grid stabilization and the integration of renewable energy sources. The economic viability of these systems, however, remains a key concern for their widespread adoption.

What are the benefits of energy storage systems?

The deployment of energy storage systems (ESS) can also create new business opportunities, support economic growth, and enhance the competitiveness of the power market. There are several ESS used at a grid or local level such as pumped hydroelectric storage (PHES), passive thermal storage, and battery units [ , , ].

How can energy storage systems improve the lifespan and power output?

Enhancing the lifespan and power output of energy storage systems should be the main emphasis of research. The focus of current energy storage system trends is on enhancing current technologies to boost their effectiveness, lower prices, and expand their flexibility to various applications.

Can prosumers own energy storage system?

With the rapid development of distributed renewable energy, energy storage system plays an increasingly prominent role in ensuring efficient operation of power system in local communities. However, high investment cost and long payback period make it impossible for prosumers to own the storage system.
