

Solar Distributed Generation

What is a distributed solar PV system?

Skip to: Distributed, grid-connected solar photovoltaic (PV) power poses a unique set of benefits and challenges. In distributed solar applications, small PV systems (5-25 kilowatts [kW]) generate electricity for on-site consumption and interconnect with low-voltage transformers on the electric utility system.

What is distributed solar generation?

Distributed solar generation (DSG) has been growing over the previous years because of its numerous advantages of being sustainable, flexible, reliable, and increasingly affordable. DSG is a broad and multidisciplinary research field because it relates to various fields in engineering, social sciences, economics, public policy, and others.

How can distributed generation be used to generate electricity?

Specifically: Existing cost-effective distributed generation technologies can be used to generate electricity at homes and businesses using renewable energy resources such as solar and wind. Distributed generation can harness energy that might otherwise be wasted--for example, through a combined heat and power system.

Can a distributed generation energy system be off grid?

While distributed generation energy systems can be off grid, they can also be linked to local energy grids through interconnection. Interconnection requires support technology such as inverters, which convert direct current (DC) electricity into alternating current (AC) electricity.

What is distributed generation & storage?

Distributed generation and storage enables the collection of energy from many sources and may lower environmental impacts and improve the security of supply. One of the major issues with the integration of the DER such as solar power, wind power, etc. is the uncertain nature of such electricity resources.
