How do you design a solar system?
Effective PV system design involves strategic solar panel placement. Aim for maximum sun exposure all year round,considering the seasonal changes in the sun's trajectory. Commonly,this means south-facing panels in the northern hemisphere. The system size should balance your energy consumption,roof size,and budget.

How do portable solar panels work?
Portable solar panel systems typically store their energy in a portable power station. Portable Power Stations contain everything you need to convert solar power into electricity and store it in a solar battery for later use. If you're not using a portable power station,the most common types of solar batteries are lead-acid or lithium phosphate.

How do solar panels generate electricity?
Photovoltaic (PV) technologies - more commonly known as solar panels - generate power using devices that absorb energy from sunlightand convert it into electrical energy through semiconducting materials. These devices,known as solar cells,are then connected to form larger power-generating units known as modules or panels.

Should you use a solar system with a generator backup?
With a PV system in place,you become the master of your own energy destiny. For those seeking additional energy security and resilience,combining solar panels with battery storage or generator backup can be a game-changer. These options ensure that you have a backup power supply during periods of low sunlight or grid outages.
