

What are solar thermal technologies for power generation?

This chapter also covers the recent developments in solar thermal technologies for power generation. In recent times, solar thermal technologies are integrated with conventional fossil-fuelled power plants as well as other renewable energy sources such as biomass, geothermal to improve its performance.

Which thermodynamic cycle is used for solar thermal power generation?

Rankine, Brayton, and Stirling cycles are commonly used thermodynamic cycles for solar thermal power generation. The integration of thermal energy storage and hybridization of solar thermal energy systems with conventional power generation systems improves the performance and dispatchability of the solar thermal systems.

What is solar thermal plant?

Solar thermal plant is one of the most interesting applications of solar energy for power generation. The plant is composed mainly of a solar collector field and a power conversion system to convert thermal energy into electricity.

What is solar energy consumption?

It is defined as the ratio of the supplied energy, including the produced energy from solar collectors and that from the auxiliary system, to the total consumed energy that involves the electrical consumption of all the system's devices along with the energy consumption of the auxiliary system, as expressed by Eq. (1.12).

How to compare the different solar thermal power generation systems?

To compare the different solar thermal power generation systems, some key characteristics/parameters are important to analyze the performance of the power generation system. Some of those parameters are discussed as follows: Aperture is the plane of entrance for the solar radiation incident on the concentrator.

What are the different types of solar energy utilization?

The solar energy utilization has been classified broadly as low-, medium- and high-temperature system. Low-temperature system such as flat plate collectors works at a maximum temperature of 100°C , whereas medium temperature system such as line focusing technology works at a maximum temperature of 400°C .
