

# The current status of energy storage in my country's power system

Can electrical energy storage solve the supply-demand balance problem?

As fossil fuel generation is progressively replaced with intermittent and less predictable renewable energy generation to decarbonize the power system, Electrical energy storage (EES) technologies are increasingly required to address the supply-demand balance challenge over a wide range of timescales.

Can energy storage technologies be used in power systems?

The application scenarios of energy storage technologies are reviewed and investigated, and global and Chinese potential markets for energy storage applications are described. The challenges of large-scale energy storage application in power systems are presented from the aspect of technical and economic considerations.

Which countries use energy storage systems?

Fig. 1 shows the current global installed capacity of energy storage system ESS. China, Japan, and the United States are among the most used countries for energy storage systems. RESs are eco-friendly, easy to evolve, and can be applied in all fields like commercial, residential, agricultural, and industrial.

Which country has the highest installed capacity of energy storage?

In recent years, cumulative installed capacity of energy storage with the fastest growth is in the area of frequency regulation service, where the energy storage accounts for up to 23%. The United States has the largest installed capacity, frequency regulation market and commercial projects.
