

## The principle of solar power generation by the river

### What is solar power?

Solar power is the conversion of sunlight into electricity, either directly using photovoltaic (PV), or indirectly using concentrated solar power (CSP). The research has been underway since very beginning for the development of an affordable, in-exhaustive and clean solar energy technology for longer term benefits.

#### Can floating solar photovoltaic plants be integrated with hydropower reservoirs?

To mitigate these challenges, a pioneering approach of integrating Floating Solar Photovoltaic (FSPV) plants with hydropower reservoirs emerges. This research focuses on the Srisailam hydropower reservoir, estimating FSPV potential in four scenarios and evaluating two floating structures.

#### How is electricity generated at hydropower plants?

Hydropower utilizes turbines and generators to convert that kinetic energy into electricity, which is then fed into the electrical grid to power homes, businesses, and industries. HOW EXACTLY IS ELECTRICITY GENERATED AT HYDROPOWER PLANTS? Because hydropower uses waterto generate electricity, plants are usually located on or near a water source.

#### How does precipitation hydropower work?

The energy of this water cycle, which is driven by the sun, is tapped most efficiently with Precipitation hydropower. Impoundment hydropower-uses a dam to store water. Water may be released either to meet changing electricity needs or to maintain a constant reservoir level.

How can regional power pools improve the viability of hydropower development?

Regional power pools for the electricity technology may enhance the viability of hydropower development through regional energy markets. This shall also make the case for large-scale hydropower development and shall reduce the dependence on fossil fuels which are often imported.

#### How do run-of-river hydroelectric systems generate electricity?

Run-of-river hydroelectric systems generate electricity by using the natural flow of a river or stream to turn a turbineand generate electricity. These systems differ from conventional hydroelectric power plants, which use a dam to create a reservoir and control the flow of water.
