Why is load shedding a problem in developing countries?

Often because of limitations in generation capacity of power stations, many developing countries frequently resort to disconnecting large parts of the power grid from supply, a process termed load shedding. This leaves households in disconnected parts without electricity, causing them inconvenience and discomfort.

Which load shedding solution is best?

Of all fair load shedding solutions, CM delivers the maximum comfort to all agents under this metric. This is as expected, with the objective of the model being to maximize comfort. The next best performing solution in this category is SM, with CSA1 and GA also performing well.

What is automatic load monitoring & load shedding?

Further, the essence of this work is to improve reliability and ensure continuous power supply by using automatic load monitoring and load shedding devices for essential and critical loads to ensure continuous power supply to critical load even with the limited availability of power supply.

What should be considered when developing a fair load shedding solution?

A fair load shedding solution should take these heterogeneous needs into account in fairly implementing load shedding, as in a resource allocation problem. Thereupon, we first propose that the needs of households within buses or substations should be considered when developing fair load shedding solutions.

How long does a load shedding solution last?

The average runtimes of all load shedding solutions after nine executions. As can be seen in Fig. 9, the execution time of the MIPs grow polynomially and does not entirely depend on the population of agents.

Insights from this analysis also demonstrate that by taking adequate steps (starting immediately), solutions to resolving load shedding are within reach.
