How do you lift solar panels to the roof?

I finished installing my DIY solar system grid tie 7.1KW on the end of 2019, but I want to share with you guys the methods I used to lift the panels to the roof. For the first 16 panels I run a steel cable between two tall trees over the top of the house. Used a pulley system to lift it and move the panel to the roof. You can see it on this video:

How does solar panel lifting work?

Solar Panel lifting requires an exact and careful approach to protect panels and the people involved. The process includes assessing the weight and dimensions of panels before selecting the most effective path onto the roof and appropriate equipment such as hoists or cranes for the safe transport of loads.

How to choose the right lifting equipment for solar panels?

Understanding the weight and dimensions of the solar panels is crucial to choosing the appropriate lifting equipment and method. Utilizing the right lifting equipment, such as cranes, hoists, or lifts, specifically designed for the task, ensures stability and control during the lifting process.

Can solar panels be lifted on a roof?

Lifting solar panels onto a roof requires specialized equipment based on the weight, dimensions, and height of the installation.

Can you lift solar panels yourself?

Though technically possible to lift solar panels yourself without professional assistance, doing so should only be attempted if you possess experience and the appropriate tools and equipment. Solar panels can be heavy and fragile objects which if improperly handled can lead to injuries or permanent damage to the panels themselves.

Why do solar panels need to be lifted?

Weather plays a significant role in lifting solar panels. Wind can cause instability, rain can make surfaces slippery, and storms can create hazardous conditions. It's essential to monitor weather forecasts and have contingency plans in place.
