How do solar photovoltaic cells work?

Solar photovoltaic cells are grouped in panels, and panels can be grouped into arrays of different sizes to power water pumps, power individual homes, or provide utility-scale electricity generation. Source: National Renewable Energy Laboratory (copyrighted)

What is a solar PV system?

Power being generated by solar panels or be used in a home. Here are some quick definitions to help you. Solar photovoltaic (PV) systems are made up of several panels. Each panel has many cells made from layers of semi-conducting material, usually silicon.

Can a photovoltaic system be connected to a building electrical installation?

Indeed, a photovoltaic system can be connected to the building electrical installation at different places: to the main low-voltage (LV) switchboard, to a secondary LV switchboard, or upstream from the main LV switchboard. These options, their advantages and drawbacks are discussed in this blog post. 1.

How does a solar PV system work?

As shown in Fig 1, the PV system incorporates a number of PV modules which convert the energy of solar radiation emitted by the sun into electrical energy by means of the photovoltaic effect. The modules are connected into series 'strings' to provide the required output voltage and arranged into one or more arrays.

What is a photovoltaic (PV) cell?

A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy.

How do solar panels work?

When the sun shines on a solar panel, solar energy is absorbed by individual PV cells in the panel. These cells are made from layers of semi-conducting material, most commonly silicon. The PV cells produce an electrical charge as they become energised by the sunlight. This electrical charge creates a direct current (DC) of electricity.
