What is the big solar energy glossary?

The Big Solar Energy Glossary defines and simplifies some of the top solar words, industry acronyms and green energy terms to help you more easily navigate the sector and make more informed decisions. All terms and acronyms are defined in the context of solar energy.

How are solar panels rated?

Solar panels are rated by how much electricity they produce (power output in Watts), how well they convert sunlight into energy (efficiency in percentage), and their durability. The power rating tells you their electricity output, which is known as the solar panel wattage.

What is a building integrated photovoltaic (BIPV)?

Building-integrated photovoltaic (BIPV): Solar panels that can be integrated with a building's roof tiles rather than mounted on top of the roof. Also known as a solar shingle. Ground-mounted solar: Solar panel systems mounted in a foundation on a large plot of open land.

Is a 600 watt solar panel a good wattage?

Although higher-wattage solar panels exist, such as Trina Solar's 600+ watt module, they are often too large for widespread use. Like solar panel wattage ratings, solar module output assumes ideal conditions for generating solar electricity, and a solar system's total power generation depends on the solar panels' wattage.

What is a photovoltaic system?

Photovoltaics (PV): Devices that convert solar energy into electricity using semiconductors (this conversion is called the photovoltaic effect). Solar panels are photovoltaics and make up a PV system. Power output/rating: The number of watts a solar panel produces in ideal conditions.

How much power does a solar panel produce?

Typically, a modern solar panel produces between 250 to 270 watts of peak power (e.g. 250Wp DC) in controlled conditions. This is called the 'nameplate rating', and solar panel wattage varies based on the size and efficiency of your panel. There are plenty of solar calculators, and the brand of solar system you choose probably offers one.
