

What is the role of photovoltaic panels chasing light

How do photovoltaic solar panels work?

Photovoltaic solar panels are much more common than those that utilize thermal conversion, so we'll be focusing on PV solar panels. Sunlight strikes the solar cells of the solar panel. Some of the rays of light or photons pass through the outer layers of the cell and into the silicon core.

How is sunlight manifested in a photovoltaic system?

Sunlight is manifested in several ways including visible light, infrared radiation, and ultraviolet light. Visible light - This is the portion of the solar spectrum that we can see. It is an essential component in photovoltaic systems, which convert solar energy to electrical energy.

Why are solar panels useful?

It is this effect that makes solar panels useful, as it is how the cells within the panel convert sunlight to electrical energy. The photovoltaic effect was first discovered in 1839 by Edmond Becquerel. When doing experiments involving wet cells, he noted that the voltage of the cell increased when its silver plates were exposed to the sunlight.

Where does the photovoltaic effect occur?

The photovoltaic effect occurs in solar cells. These solar cells are composed of two different types of semiconductors - a p-type and an n-type - that are joined together to create a p-n junction. To read the background on what these semiconductors are and what the junction is, [click here](#).

How does a solar panel generate electricity?

At the heart of a solar panel's ability to generate electricity is the photovoltaic (PV) effect. Discovered in 1839 by French physicist Edmond Becquerel, the PV effect is the process by which solar cells within the panel convert sunlight into electricity.

What is the PV effect?

Discovered in 1839 by French physicist Edmond Becquerel, the PV effect is the process by which solar cells within the panel convert sunlight into electricity. Each solar cell is made primarily of silicon, a semi-conductor material that plays a critical role in this conversion process.

Sunlight strikes the solar cells of the solar panel. Some of the rays of light or photons pass through the outer layers of the cell and into the silicon core. When the photons enter the core, they excite and free the electrons.
