

Can wind and solar power reduce wholesale electricity prices?

As a result, WT and PV generated electricity needs to be complemented by other type of generators (Hirth, 2013). In the short-run wind and solar energy can lower the wholesale electricity price by displacing more expensive generators (Hirth, 2013). However, the long-run merit order effect is much less clear.

Does WT and PV based generation affect wholesale electricity prices?

We find a strong contemporaneous merit order effect of WT and PV based generation in the Australian wholesale electricity market. We find that an extra GW of dispatched wind capacity decreases the wholesale electricity price by 11 AUD/MWh, while dispatched solar capacity by 14 AUD/MWh.

Are traditional power markets compatible with wind and solar power?

For substantial improvements over past systems. However, as we will describe in an upcoming paper, traditional power markets may not be compatible with the sheer amounts of wind and solar power. What drives wholesale electricity prices?

Wholesale electricity prices are driven by numerous forces, including a growing amount of wind and solar power. Market forces can include generation costs affected by fuel prices (especially natural gas), or high levels of demand driven by hot weather (such as air conditioning), or tight markets where demand is nearly equal to all available supply.

Are wind turbines and solar photovoltaic cells generating electricity in Australia?

In line with developments in many countries around the world, electricity generation capacity based on wind turbines (WT) and solar photovoltaic cells (PV) has been rapidly increasing over the last decade in Australia.

Does solar power increase wholesale electricity prices in Australia?

An extra GW solar capacity decreases the wholesale electricity price by 14 AUD/MWh. Increases in gas prices counteract the merit order effect of renewables. Our paper investigates the effect of wind and utility-scale solar electricity generation on wholesale electricity prices in Australia over 2010-2018.

The efficiency (η_{PV}) of a solar PV system, indicating the ratio of converted solar energy into electrical energy, can be calculated using equation [10]: $\eta_{PV} = P_{max} / P_{in} \dots$
