What are the components of a wind turbine?

This contains all the components that sit on top of the tower, except the rotor system. It includes main shaft, gearbox, generator, brake, bearings, nacelle frame, yaw mechanism, auxiliary crane, hydraulic system, and cooling system. 1. Rotor System The rotor system captures wind energy and converts into rotational kinetic energy.

What is a main bearing for a wind turbine?

the Creative Commons Attribution 4.0 License. This paper presents a review of existing theory and practice relating to main bearings for wind turbines. The main bearing performs the critical role of supporting the turbine rotor, with replacements typically requiring its complete removal.

How does a gearless wind turbine work?

In a gearless wind turbine, the main bearing is mounted between the main shaft and generator frame. The possible dissipation paths for the main shaft voltage are the ground brush and the main bearing. In one of the different types of gearless turbines, the main shaft is directly connected to the generator.

Do wind turbine main drive systems have internal and external excitation?

Currently, many scholars have fully studied the internal and external excitation of the mechanical parts in wind turbine main drive systems. Zhou et al. 5 considered the gear-bearing coupling and studied the dynamic characteristics of the wind turbine planetary gear system under variable loads.

How do wind turbine bearings work?

Bearing current, characterized by a flow through the bearing, is driven by a voltage potential between the inner and outer races. In wind turbines, the main shaft's inner race connects to the main shaft, while the outer race links to the bearing house mounted on the nacelle frame.

How does a geared wind turbine work?

In a geared wind turbine, the gearbox is mechanically connected to the main shaft and to the generator via an insulated coupling. Thus, the generator has no direct electrical contact to the main shaft. The main shaft voltage is dissipated via the ground brush, main bearing and gearbox bearing.

How does a turbine generate electricity? A turbine, like the ones in a wind farm, is a machine that spins around in a moving fluid (liquid or gas) and catches some of the energy passing by. All sorts of machines use turbines, ...
