How do I connect an isolation transformer?

This can be achieved inside the isolation transformer by connecting the yellow/green jumper wire (included) between male spade terminals J34A and J34, as indicated below. AC input earth is connected to AC output earth when the vessel is out of the water (on land) during winter or for maintenance.

What is a 12 KVA isotransformer?

APPLICATION The 12 KVA IsoTransformer is a shoreline isolation transformer intended for boats with 50 amp/240 volt service. Properly installed it will electrically isolate AC shore power from the boat's AC power system reducing galvanic current corrosion due to the AC shore power connection.

Do I need a GFCI in my isolation transformer?

A GFCI must be installed in the AC output of the isolation transformer. For the GFCI to operate correctly, the AC output neutral must be connected to the AC output earth and ground (= all the metal parts in the vessel).

How does an isolation transformer work?

An isolation transformer transfers electrical energy through magnetic induction. Due to this physical separation of the primary and secondary windings, any fault in the primary circuit does not directly affect the secondary circuit.

How do I select a drive isolation transformer?

Select the Drive Isolation Transformer according to the recommendations from the motor drive system manufacturer or supplier. If this information is unavailable, use the table below as a guide for selecting the transformer kVA for a required motor horsepower. Neutral terminal for field connection (on applicable units).

What is a HPS drive isolation transformer?

HPS Drive Isolation Transformers are designed to meet the rugged demands of both AC and DC variable speed drives and also to provide the required voltage change. The separate primary and secondary windings provide electrical isolation between the incoming line and the SCR load.

1x isolation transformer. 1x long yellow/green jumper wire with female 6.35 mm spade connectors, used to connect AC input earth (PE) to AC output earth (PE) when the vessel is out of the water for maintenance or winter storage.
